

ViviGen[®] Storage FAQ

What is the appropriate storage condition for ViviGen?

- After removal from the shipper, ViviGen must be stored immediately in its original packaging at -70°C or colder until ready for use.
- Although ViviGen must be stored at -70°C or colder, it is recommended that the freezer used to store ViviGen be set at -86°C as the operating set point. Additionally, setting up a temperature alarm set point of -75°C or colder would ensure maximum time to react to alarms while minimizing the possibility of the freezer going out of temperature specification.
